AB The kinetics of enzymic cholinesterase hydrolysis of **dicarboxylic acid** esters [MeN(R)-(CH2)n-O2C-(CH2)m-CO2-(CH2)n-(R)NMe + 2 MeI or 2 HCl, R = Me, 1-adamantyl; m = 1,2,4,6,8; n = 2,4] with neuromuscular-blocking activity was studied in vitro. The maximum hydrolysis rate was shown to increase on elongation of the distance between **ester** groups, both in the compds. containing a hydrophobic adamantyl radical attached to **quaternary** nitrogen, and in bis esters not containing adamantyl radicals. The comparison of neuromuscular-blocking activity in vivo, enzymic hydrolysis rates, and activity on isolated skeletal muscle demonstrated that in vivo activity is more strongly correlated with the maximum hydrolysis rate of the compds. than with activity in isolated skeletal muscle.

AB Reaction of I(CH2)nI (n 5, 6, 7) with RNMe2 (R = 1-adamantyl) gave 50-62.5% the corresponding Me2N+R(CH2)nN+-Me2R.2I- (I). I (n = 6) was a ganglion-blocking agent at 0.12-0.2 mg/kg in cats (hexonium = 40 mg/kg). Transesterification of di-Me 1,3-adamantanedicarboxylate with HO(CH2)2NMe2, followed by reaction of the resulting **ester** with MeI gave the bisammonium compound II. Reaction of 1,1'-diadamantyl-3,3'-**dicarboxylic acid** chloride with 1-methylpiperazine

followed by MeI gave the bispiperazinium salt III. III was an effective ganglion-blocking agent at 4-5 mg/kg in cats.

AB Cis-(2-acetoxycyclobutylmethyl)trimethylammonium iodide (cis-I) [38868-89-2] and trans-(2-acetoxycyclobutylmethyl)trimethylammonium iodide (trans-I) [38868-90-5] had 40,000-fold and 5000-fold lower muscarinic activity, resp., than acetylcholine [51-84-3] in the superfused guinea pig ileum in vitro. The effects of both were blocked by atropine [51-55-8] but not by hexamethonium [**60-26-4**]. To synthesize cis-I, cis-cyclobutane-1,2-**dicarboxylic acid** mono-Me **ester** [31420-52-7] was converted with SOCl2 to the mono-Me **ester** monoacyl chloride, with Me2CD to the mono-Me **ester** Me ketone, and with m-chloroperbenzoic acid to Me cis-2-acetoxycyclobutanecarboxylate [38868-92-7]. Aminolysis with NHMe2 gave a mixture of products which was reduced with LiAlH4 to cis-2-dimethylaminomethylcyclobutanol [38868-93-8]. This was **quaternized** with MeI and acetylated to yield cis-I. Trans-I was synthesized similarly.

AB The muscle-relaxing properties of **quaternized** amino alc. esters of 3,4-diphenyl- (I), 3,4-dimethyl- (II), 3,4-di(2-furyl)- (III), and 3,4-bis(5-nitro-2-furyl)thiophene-2,5-**dicarboxylic acid** (IV); phenanthreno[9,10-c]thiophene-1,3-**dicarboxylic acid** (V); and 2,3-diphenylbenzene-1,4- (VI), 3,6-diphenylbenzene-1,2- (VII), and 2,5-diphenylfuran-3,4-**dicarboxylic acid** (VIII) were determined I (10 g.) was boiled with 300 ml. $SOCl_2$ and worked up to give 8.1 g. I dichloride (IX), m. 123-4°. Similarly prepared were 37% II dichloride (X), m. 67-73°; III dichloride (XI), 91%, m. 90.5-1.5° (ligroine); IV dichloride, m. 92.5-95° (C_6H_6); V dichloride (XII), 37%, m. 193-4° (C_6H_6); and VI dichloride (XIII), 80%, m. 153.5-56° (decomposition) (ligroine). VIII (5.5 g.) was added in small portions with stirring to an ice-cold suspension of 16 g. PCl_5 in 55 ml. Et_2O, stirred 30 min., and worked up to give 4.8 g. VIII dichloride (XIV), m. 120-1° (twice from ligroine). Crude II in dioxane was treated with CH_2N_2 in Et_2O, kept 3 hrs., and worked up to give 36% di-Me **ester**, m. 171.5-2.5° (also prepared by heating X and MeOH), which was refluxed in methanolic KOH and worked up to give pure II, decompose 324-7°. Similarly, III (at -5°), gave 90% di-Me **ester**, m. 129° (twice from AcOH), which, at -5° in Ac_2O, was nitrated with HNO_3 (d. 1.52), stirred 1 hr., and worked up to give IV di-Me **ester**, m. 182-4°, which refluxed 2 min. in methanolic KOH and worked up gave IV, m. 258° (decomposition). A suspension of 2 g. 1,4-dimethyl-2,3-diphenylbenzene in 60 ml. C_5H_5N and 20 ml. H_2O containing 25.3 g. $KMnO_4$ was refluxed 2 hrs. and worked up to give 2.2 g. VI, m. 308-11°. IX (15.6 g.) and 25.2 g. β-diethylaminoethanol (DEAE) was refluxed 6 hrs. in 500 ml. dry C_6H_6 and worked up to give 14.8 g. I bis(β-diethylaminoethyl **ester**), m. 76.5-77° (ligroine); dipicrate m. 175.5-77° (1:1 Me_2CO-H_2O); di-HBr salt m. 185.5-6.5° (Me_2CO-iso-PrOH); dimethiodide m. 212-13° (decomposition); bis(benzyl bromide) decomposed 191°, m. 240-7° (EtOH-EtOAc). The following were prepared II bis(β-diethylaminoethyl **ester**), 70% [di-HBr salt m. 212.5-14° (decomposition); dimethiodide m. 202.5-2.5° (decomposition)]; III bis(β-diethylaminoethyl **ester**), 61%, n22D 1.459, by shaking XI and DEAE in C_6H_6 66 hrs. at room temperature and working up [di-HBr salt, m. 179.5-81° (decomposition); dimethiodide m. 177.5-79° (decomposition)]; IV bis(β-diethylaminoethyl **ester**), 47%, m. 42-7° (dimethiodide m. 192-5°); VI bis(β-diethylaminoethyl **ester**), 62%, n22D 1.540 [di-HBr salt m. 185.5-7.5° (EtOAc:EtOH); dimethiodide, m. 234-5° (decomposition)]; VIII bis(β-diethylaminoethyl **ester**), 74% [di-HBr salt m. 180-1° (3:1 Me_2CO-EtOH); dimethiodide m. 185.5-87° (decomposition)] I bis(β-dimethylaminoethyl **ester**) 65%, m. 69-79° (ligroine) [dimethiodide decomposed 225-50° (EtOH)]; and V bis(β-diethylaminoethyl **ester**), 90%, [di-HCl salt, decompose 211-12.5°; dimethiodide m. 215-16° (decomposition)]. XII (1.25 g.) and 1.1 g. MeOH refluxed in 5 ml. C_6H_6 and cooled precipitated 0.85 g. V di-Me **ester**, m. 118-19°. DEAE (4.7 g.) in 50 ml. Me_2CO was added to 12 g. VII anhydride suspended in 250

ml. dry refluxing Me2CO, and the mixture refluxed 20 min. to precipitate 14.6 g. of the half **ester**, m. 205-22°, difficulty soluble in 2N NaOH and 2N HCl. This intermediate (8.35 g.) and 5.4 g. β-diethylaminoethyl chloride was refluxed 6.5 hrs. in 160 ml. dry iso-PrOH and worked up to give 7.3 g. VII bis(β-diethylaminoethyl **ester**), m. 99-100° (ligroine and petroleum ether); di-HBr salt m. 193-5°; dimethiodide m. 206.5-7.5° (decomposition). The anhydride (5 g.) of cis, cis, cis,cis-3,6-diphenyl-1,2,3,6-tetrahydrobenzene-1,2-**dicarboxylic acid** in 80 ml. HCONMe2 was hydrogenated at atmospheric pressure and room temperature over Pd(OH)2 on BaSO4 and worked up to give 3.3 g. anhydride of cis, cis, cis, cis-3,6-diphenylcyclohexane-1,2-**dicarboxylic acid**, m. 220-2° (EtOAc). A solution of 4.8 g. 2,7-diaminodiphenylene sulfone and 14 g. di-Et diacetylsuccinate in 20 ml. AcOH was refluxed 45 min. and cooled to precipitate 12.5 g. XV, m. 251-3° (BuOH:AcOH), saponified to the free acid by methanolic KOH. A mixture of 1.28 g. 2,2'-dihydroxy-5,5'-dimethyldeoxybenzoin in 2N NaOH and 1 g. ClCH2CO2H solution neutralized with K2CO3 was refluxed 3 hrs. and worked up to give 2-hydroxy-2'-carboxymethoxy-5,5'-dimethyldeoxybenzoin, m. 159-61° (60% EtOH), and 2,2'-dicarboxymethoxy-5,5'-dimethyldeoxybenzoin, m. 172-4° (60% AcOH and 60% EtOH). Extensive biol. data are given.

L9 ANSWER 6 OF 17 CAPLUS COPYRIGHT 2005 ACS on STN
ACCESSION NUMBER: 1968:401562 CAPLUS

DOCUMENT NUMBER: 69:1562
TITLE: Cyclobutanedicarboxylic acids. VI. Relation between curariform activity and structure in a series of alkamine cyclobutanedicarboxylic acid derivatives
AUTHOR(S): Kharkevih, D. A.; Arendaruk, A. P.; Skoldinov, A. P.
CORPORATE SOURCE: Mosk. Med. Inst. im. Sechenova, Moscow, USSR
SOURCE: Khimiko-Farmatsevticheskii Zhurnal (**1968**), 2(3), 7-11
CODEN: KHFZAN; ISSN: 0023-1134
DOCUMENT TYPE: Journal
LANGUAGE: Russian

AB The curariform activity of a series of alkamine cyclobutane **dicarboxylic acid** derivs. was determined by drooping head symptom in rabbits and by a study of the effect of the compds. on the transfer of stimulation from the sciatic nerve to the gastrocnemius muscle of cats. Activity was studied in relation to 4 structural features: distance between the **quaternary** N atoms, radicals shielding these N atoms, stereoconfiguration of the truxillic acids, and the structure of the aliphatic part of the mol. separating the 2 **quaternary** N atoms. The bis(N-methylpiperidino)cyclobutanedicarboxylates and bis(diethylmethylammonium)cyclobutanedicarboxylates with 11 C and 2 O atoms between the 2 **quaternary** groups were the most effective curariform agents. The α-truxillic acid derivs. were the most effective and the γ-truxillic acid derivs. the least effective in suppressing transfer of nerve impulses. Replacement of **ester** groups with amides increased the curariform activity of the diphenylcyclobutanedicarboxylic acid bisquaternary ammonium salts. These compds. apparently are antidepolarizing curariform substances which interact with only 1 choline receptor. 21 references.

AB Bicyclic diacids (I) are esterified by basic alcs. to give II. The corresponding hydrogenated esters IV and the **quaternary** salts (II.R5X) (III) and (II.R5X) (V) of II and IV resp. are prepared All these compds. have pharmacol. properties, such as action on muscle nerves or blocking effect on ganglions. The esters are prepared from the dichlorides of I; e.g., a solution of 20 g. of dichloride of 1,4-endomethylene-2,3-trans-dicarboxy-5-cyclohexene (Ia) in 100 ml. benzene is added to 40 g. Me2NCH2CH2OH in 100 ml. benzene. The solution is refluxed, washed with 20% NaOH, and with water. Distillation gives II (n = 1, R1 = R2 = H, R4 = R3 = Me) in 95% yield, b2 180-90; n20D 1.4732; d254 1.0422. Corresponding III(n = 1) prepared are (R5X and m.p. given): HCl, 203-5°; MeI, 227-33°; EtI, 225-9°; EtBr, 191-5°. Hydrogenation of

the same II in AcOH over Pd-C gives IV (n = 1) in 80% yield: b2 175-80°; n25D 1.4729; d204 1.011. Corresponding V(n = 1) prepared are (R5X and m.p. given): HCl, 188-92°; MeI, 169-73°. Other aminoalcs. are used to give the following derivs.: II (n = 1, R3 = R4 = Et, R1 = R2 = H), b5 205-15°; n25D 1.4695; d204 0.9981; III (n = 1, R3 = R4 = Et, R1 = R = H (R5X and m.p. given): HCl, 149-53°; EtI, 247-53°; II (n = 1, R1 = H, R2 = R3 = R4 = Me), b5 190-5, n25D 1.4677, d204 1.0064; III (n = 1, R1 = H, R2 = R3 = R4 = Me), HCl, 228-32°; II[n = 1, R1 = R2 = H, (NR3R4) = piperidino], b5 205-25; n25D 1.4952; III [n = 1, R1 = R2 = H, NR3R4 = piperidino], HCl, deliquescent crystals; MeI, oil. In the 1,4-endoethylene-2,3-trans-dicarboxy-5-cyclohexene series (n = 2), the following compds. are prepared by the same method (R5X and mp. given): II (n = 2, R1 = R2 = H, R3 = R4 = Me), b2 175-95; III (n = 2, R1 = R2 = H, R3 = R4 = Me, R5X = MeI), m. 235-8°; II(n = 2, R1 = R2 = H, R3 = R4 = Et), b2 210-25; III (n = 2, R1 = R2 = H, R3 = R4 = Me), HCl, 163-8°; EtBr, 204-9°; II (n = 2, R3 = R4 = Me, R4 = H, R2 = Me), b2 200-10°; III (n = 2, R2 = R3 = R4 = Me, R1 = H), HCl, 170-80°; MeI, 215-30°. Transesterification is also used to prepare II. E.g., 20 g. of the di Me **ester** of 5,6:7,8-dibenzo-2,3-trans-dicarboxybicyclo[2.2.2]octane (Diels-Alder adduct between di-Me fumarate and anthracene) is added to a solution of 0.5 g. Na in 40 g. Me2NCH2CH2OH and heated on a water bath 5 hrs. The more volatile fraction is then removed by vacuum, and the residue dissolved in benzene and washed with water. After drying over Na2SO4 and evaporation of the solvent, the oily **ester** is purified by conversion into the corresponding dihydrochloride. Dimethiodide III (n = 1, R5X = HI) (IIIa) is prepared by another method: 22 g. of the dichloride of Ia are added to an excess of cold ethylene chlorhydrin. The rough dichloroethyl **ester** of Ia obtained is refluxed in 300 ml. acetone with 30 g. NaI. After elimination of NaCl and removal of the solvent, the bis(iodoethyl) **ester** of Ia is dissolved in ether and washed with water and thiosulfate solution The product is then heated in benzene solution with Me3N in a pressure bottle at 100° 6 hrs. IIIa is recrystd. from acetone-iso-PrOH.

AB Alkali metal salts of an aromatic or aliphatic **dicarboxylic acid** monoester are heated with a mixture of 1,4-dichloro-2-butene (I) and a neutral alkali metal salt of an aromatic or aliphatic

dicarboxylic acid to give materials which can be used as plasticizers for poly(vinyl chloride) (II). Thus, 1.375 mole phthalic anhydride is dissolved in 1.52 mole BuOH at <105°, the solution is added in 1 hr. and 20 min. to a mixture of 1.25 mole I, 0.625 mole 1,4-C6H4(CO2Na)2, 0.757 mole Na2CO3, 0.016 mole Me3(PhCH2)NCl, and 312 ml. BuOH as the temperature rises from 116° to 123°, and the H2O-BuOH azeotrope is distilled The mixture is refluxed 10 hrs., washed with H2O, washed with NaOH, washed with H2O, and distilled to give 436 g. **ester** (III) saponification number 445. III (50 parts) is incorporated in 100 parts II to give a product, tensile strength 262.5 kg./cm.2, elongation at break 300%, melt index 19, volatilization loss 0.6%, as compared with 259, 280, 23, and 0.7, resp., for the control.

AB The curarelike activities of thesin (di-d-isoretronecanol **ester** of p,p'-dihydroxy-α-truxillic acid; CA 54, 24835cf) and its diiodomethylate (CA 55, 15366a) were the starting point for a closer investigation of structure-activity relations of a large number of bisquaternary salts of basic esters and amides of ε-(I), γ-(II), and α-truxillic (III) acids with the scope of elucidating the influence of (1) distance between cationic centers, (2) nature of substituents at the **quaternary** N atoms, and (3) structure of the chain between cationic centers. Determination of medium effective doses (E.D.50) was carried out on rabbits by the head-drop method; blocking of excitation transmission from the sciatic nerve to the gastrocnemius muscle was studied in decerebrate cats. The [XR(CH2)n]2 diiodide derivs. of III possessed greatest activity, where X = Et2N, piperidino, or 1-pyrrolidinyl, R = Me, and n = 3 and 4 (E.D.50, 25-33 γ/kg.; transmission blocking 100-150 γ/kg.). Compds. with n = 2, 5, 6, 7, or XMe2N, morpholino and R = Me, Et were less active, dimethiodides of dimethylaminoalkyl esters of III least active. The

influence of chain structure was studied in the dialkylaminopropylamides of I, II, and III, which possessed longer activity than the bisquaternary salts of the corresponding esters. Here also, activity decreased in the order III, I, and II derivs. All compds. investigated are nondepolarizing muscle relaxants. The X = piperidino, R = Et, n = 4 derivative, with E.D.50 = 41 γ/kg. was proposed for clin. investigation as truxillone.

AB cf. CA 54, 601b. Five compds. related to muscarine were prepared from D-glucosamine-HCl (I) or L-glucosaminic acid (II). To a vibrated solution of 6 g. D-glucosaminic acid (III) in 36 ml. N HCl was added slowly during 3 hrs. at 0-5° 2.5 g. $NaNO_2$ in 40 ml. H_2O. After standing 20 hrs. at 20°, the solution was evaporated in vacuo at 40°, the alc. solution of the residue was filtered, evaporated, the residue in H_2O neutralized with excess $CaCO_3$, the solution again filtered and evaporated, the viscous oil was digested six times with 40 ml. Me_2CO, the residual Ca chitarate dissolved in 150 ml. H_2O, and by ion exchange (Nalcite HCR) converted into chitaric acid, m. 146°, contaminated by the lactone. This acid was dissolved in a 10-fold quantity of MeOH and treated 24 hrs. with excess Me_2NH at room temperature Evaporation in vacuo gave chitaric acid dimethylamide (IV), m. 172° (EtOAc), $[\alpha]D$ 18.8° (c 1, MeOH). IV (2.4 g.) in 11 ml. HNO_3 (d. 1.2) was carefully warmed to 65°. A vigorous reaction occurred, ending after 30-5 min. After repeated evapns. of the aqueous solns., the remaining viscous oil was crystallized from Me_2CO to yield 63% 2,5-anhydro-D-saccharic acid 1-dimethylamide (V), decomposing at 203-4°, $[\alpha]D$ -2.4° (c 2.5, H_2O). From the mother liquor 2,5-anhydro-D-saccharic acid (VI) was isolated via the Ca salt (yield 0.32 g.), m. 170-1° (Me_2CO-Et_2O), $[\alpha]D$ 39.3° (c 2, H_2O). Sublimation of V in high vacuum at 220° gave 2,5-furandicarboxylic acid (VII), decomposing at 300-20°. Oxidation of 15 g. I with 41 ml. HNO_2 (d. 1.2) at 60° gave via the Ca salt 19% crude 2,5-anhydro-D-manno-saccharic acid (VIII), m. 182° (alc.-Et_2O), $[\alpha]D$ 46.3° (c 1, H_2O). Esterification of VIII in MeOH with ethereal CH_2N_2 yielded quant. the di-Me **ester** hemihydrate (IX), m. 71° (MeOH-Et_2O), $[\alpha]D$ 45.3° (c 2.5, H_2O). IX (3.1 g.) in 10 ml. MeOH with 5 g. Me_2NH 2 hrs. at 65° in an autoclave yielded 2.2 g. VIII bis(dimethylamide) (X), m. 126° (EtOAc), $[\alpha]D$ 93.3° (c 1.5, H_2O). Esterification of V in MeOH with excess ethereal CH_2N_2 yielded V 6-Me **ester** (XI), m. 165-6° (EtOAc), $[\alpha]D$ 11.5° (c 1, H_2O). XI (0.4 g.) in 5 ml. cold MeOH treated with 5 g. Me_2NH in the cold and kept 24 hrs. at room temperature yielded 0.34 g. 2,5-anhydro-D-saccharic acid bis(dimethylamide) (XII), decomposing at 202° (MeOH), $[\alpha]D$ -52.2° (c 2, H_2O). XII was also prepared from 0.3 g. VI via the di-Me **ester**; yield 0.28 g. From 1.2 g. XI in 10 ml. MeOH, saturated with NH_3 at 0°, 0.91 g. 2,5-anhydro-D-saccharic acid 1-dimethylamide 6-**amide** was obtained, decomposing at 234°, $[\alpha]D$ 3.6° (c 3.5, H_2O). Treatment of 2.5 g. XII in 15 ml. dry pyridine with 0.9 g. tosyl chloride in 15 ml. pyridine 24 hrs. at room temperature and after warming to 35° addition of 40 ml. EtOAc yielded 170 mg. 3,4-ditosyl-2,5-anhydro-D-saccharic acid 1,6-bis(dimethylamide) (XIII), m. 202-3° ($CHCl_3$-EtOAc), $[\alpha]D$ 7.8° (c 0.65, $CHCl_3$). Ca salt of VII (5 g.) in 150 ml. H_2O was hydrogenated 6 hrs. with 5 g. Raney Ni at 150°/135 atmospheric in an autoclave. After removal of the Ca++ ions by ion exchange (Nalcite HCR), 55% cis-tetrahydrofuran-2,5-**dicarboxylic acid** (XIV) was obtained, m. 125-6° (EtOAc-petr. ether). XIV was converted into its di-Me **ester** (XV) by the diazomethane method. Treatment of 1.02 g. XV in 10 ml. MeOH with 2 g. Me_2NH 2 hrs. at 90° gave 920 mg. XIV bis(dimethylamide) (XVI). The bis(dimethylamides) X, XII, XIII, and XVI were reduced by slow addition of these compds. in dioxane to $LiAlH_4$ in dioxane, the excess $LiAlH_4$ decomposed by EtOAc, the solution evaporated, 50 ml. 10N NaOH/g. $LiAlH_4$ added, the tertiary amines repeatedly extracted with Et_2O, and after evaporation **quaternized** by boiling in excess MeI. Thus, 1.5 g. X in 80 ml. dioxane gave after 3 hrs. reflux, etc., 1.26 g. 1,6-dideoxy-1,6-bis(dimethylamino)-2,5-anhydro-D-mannitol-2MeI, decomposing at 299-300° (80% alc.), $[\alpha]D$ 32.2° (c 1, H_2O). XII (0.5

g.) gave 510 mg. 1,6-dideoxy-1,6-bis(dimethylamino)-2,5-anhydro-D-sorbitol-2MeI (XVII), decomposing at 300° (75% alc.), [α]D 13.6° (c 1, H2O). Reduction of XIII gave two products because of partial or total reductive cleavage of the tosyl groups. Thus, 114 mg. XIII in 30 ml. dioxane with 200 mg. LiAlH4 in 40 ml. dioxane gave after 2 hrs. at 80-90° and 1 hr. reflux 68 mg. crude methiodide. The fraction, difficultly soluble in alc., gave after several recrystns. from 80% alc. 3- or 4-deoxy analog of XVII, decomposing at 298-300° [α]D 2.8° (c 0.7, H2O). The fraction, well soluble in alc., gave 18 mg. cis-2,5-bis(dimethylaminomethyl)tetrahydrofuran-2MeI (XVIII), decomposing at 302° (alc.), showing no rotation. The structure of XVIII was confirmed by the isolation of an identical product from the reduction of XVI in the above way. The L-form of XVII was prepared in exactly the same way as described for XVII, starting from II, with corresponding values of the phys. consts.

GI For diagram(s), see printed CA Issue.
AB cf. C.A. 53, 7136h. Several pyrroles substituted in the 2-and 5-positions of the pyrrole nucleus were subjected to the Mannich reaction. The resulting bases were shown to be 3-dialkylaminomethyl- and 3,4-bis(dialkylaminomethyl) derivs. of pyrrole. Their utility as alkylating agents was investigated. The following general procedures were used for the preparation of the Mannich bases, Me2NCH2C:CR.NR'CR: CH (I) and Me2NCH2C: CR.NR'CR:CCH2NMe2 (II). Method A. NHMe2.HCl (85 g.)in 79 g. 40% HCHO added at 60° to 100 g. 2,5-dimethylpyrrole, diluted with H2O, extracted with Et2O, and the aqueous layer poured into 200 ml. 25% NaOH gave 148 g. product. For disubstitution, the quantities of NHMe2.HCl and HCHO were doubled. Method B. NHMe2 (20 ml., 33%) and 20 ml. AcOH mixed with 8.5 ml. 40% HCHO, and the solution added dropwise under N to 17.1 g. 1-phenyl-2,5-dimethylpyrrole gave 11.1 g. product. For disubstitution, 2 moles aqueous NHMe2 and 2 moles HCHO were used. The picrates were precipitated by mixing alc. solns. of the base and picric acid and recrystg. from alc. Methiodides were prepared by addition of I or II, dissolved in a min. of alc., to 10% excess MeI with stirring at ice bath temperature and recrystg. from alc. (type of compound, R, R', % yield, m.p. or b.p./mm., method, m.p. of MeI derivative, and m.p. of picrate given): I, Me, H, 92, 99-100°, A, 130° (decomposition), 117-18°; I, Me, Ph, 49.5, 130-1°/1, B, 211-12° (decomposition), 137-8°; I, Me, Me, 69, 73-4°/1, B, 140° (decomposition), 137-8° (decomposition); I, Ph, H, 73, 124-5% B, -, 179-80°; II, Me, H, 90, 144-5°, A, 139-40°, 139-40°; II, Me, Ph, 61, 150°/1, B, 100° (decomposition), 200-1° (decomposition); II, Me, Me, 72.5, 96-7°/0.3, B, -, 181-2° (decomposition). II (R = Me, R' = H) (20 g.) in 100 ml. alc. heated 48 hrs. at 100° with 4 g. Raney Ni and H at 80-100 atmospheric gave 7.7 g. 2,3,4,5-tetramethylpyrrole, m. 107-8°, by steam distillation In a similar manner hydrogenolysis of 20 g. I (R = Me, R' = H) 8 hrs. at 80-90° gave 1.5 g. 2,3,5-trimethylpyrrole, b15 79-80°, and 7.5 g. of starting material. Di-Et acetamidomalonate (III) (16.2 g.) and 11.5 g. I (R = Me, R' = H) mixed with 100 ml. alc. containing 1.72 g. Na, treated dropwise at 35° with 15.8 g. Me2SO4, stirred overnight, and concentrated gave 18.4 g. di-Et 2,5-dimethyl-3-pyrrolylmethyl-α-acetamidomalonate (IV), m. 176-7° (alc.-H2O). Reaction of 26 g. I with 32.4 g. III in 300 ml. PhMe containing 1 g. powdered NaOH gave 24 g. IV. Condensation of 20.3 g. di-Et formamidomalonate (IVa) and 11.5 g. I (R = Me, R' = H) in alc. by **quaternization** in situ gave 19.2 g. di-Et 2,5-dimethyl-3-pyrrolylmethyl-α-formamidomalonate (V), m. 137-8.5°. Hydrolyzing 6 g. V with 50 ml. 25% NaOH 2.5 hrs., cooling, acidifying, filtering, acidifying the filtrate to pH 5, and seeding gave 3.3 g. crude material which was chromatographed to show one spot; the analysis indicated the presence of inorg. material which could not be removed. CH2(CO2Et)2 (VI) (50 g.) with 31.5 g. I (R = Me, R' = H) by **quaternization** gave 35.5 g. di-Et 2,5-dimethyl-3-pyrrolylmethylmalonate, b2 173-5°. Reaction of 20.8 g. 2,5-diphenyl-3-(dimethylaminomethyl)pyrrole and 20.3 g. IVa by the in situ **quaternization** method gave 31.05 g. di-Et 2,5-diphenyl-3-pyrrolylmethyl-α-formamidomalonate (VII), m. 164-5° (alc.-H2O). VII (5 g.), 10 g. KOH, and 50 ml. 80% alc. refluxed overnight gave 1.5 g. 2,5-diphenyl-3-pyrrolealanine, m. 217-18° (decomposition). VI (64 g.) containing 1.84 g. Na heated 6 hrs. at 120° under N with 26 g. I.MeI (R = Me, R' = Ph), H2O added, and the mixture extracted with Et2O and distilled gave 23.6 g. VI and 11.4 g. di-Et 1-phenyl-2,5-dimethyl-3-

pyrrolylmethylmalonate, b0.1 164-5°, n25D 1.5230. By the above procedure there was obtained after 24 hrs. 6.8 g. di-Et 1,2,5-trimethyl-3-pyrrolylmethylmalonate, b0.9 145-6°, n25D 1.4670. I.MeI (R = Me, R' = Me) (55 g.), 30 g. NaCN, and 200 ml. H2O heated under N until evolution of basic gas ceased gave 5.5 g. 1,2,5-trimethyl-3-pyrroleacetonitrile (VIII), b0.2 90°, n25D 1.1527, ν 2250 cm.-1. The pot residue consisted of a tarry solid which liberated NH3 on treatment with base and probably contained some **amide**, due to partial hydrolysis of VIII. VIII (5 g.), 5 g. KOH, and 50 ml. 80% alc. refluxed 8 hrs., diluted with H2O, and poured over ice containing 10 ml. concentrated HCl, and the oil which separated taken up in Et2O gave 3.2 g. 1,2,5-trimethyl-3-pyrroleacetic acid (IX), m. 120-1° (ligroine). 1,2,5-Trimethylpyrrole (90 g.) and 4 g. Cu powder treated dropwise with 48 g. N2CHCO2Et, stirred 3 hrs., the Cu removed, and the filtrate distilled in vacuo gave 72.5 g. unchanged pyrrole and 18.8 g. Et 1,2,5-trimethyl-3-pyrroleacetate (X), b5 124-5°, n27D 1.4919. Hydrolysis of X with 80% alc. alkali gave 2.76 g. IX. I.MeI (R = Me, R' = Ph) (40 g.) and 30 g. NaCN similarly gave 9 g. 1-phenyl-2,5-dimethyl-3-pyrroleacetonitrile (XI), b0.6 144-5°, n25D 1.5246, ν 2250 cm.-1 (CN band). XI (3 g.) on saponification gave 2.5 g. 1-phenyl-2,5-dimethyl-3-pyrroleacetic acid, m. 151-2° (ligroine).

OTHER SOURCE(S): CASREACT 53:94484

AB 3-Methylene-1,4-diphenyl-2-methylcyclobutene (I) and diphenyldimethylenecyclobutene (II) were synthesized from β-truxinic acid (III) by a series of conventional transformations which included Hofmann degradation of appropriate bis(**quaternary** hydroxides) in the final steps. I and II reacted with (NC)2C:C(CN)2 (IV) by 1,2-cycloaddn. to yield spirocyclobutane derivs. 3-Methylenecyclohexene

(V) showed similar 1,2-cycloaddn. IV and norbornadiene (VI) also formed a 1:1 adduct. III (64 g.), 300 cc. absolute EtOH, 150 cc. PhMe, and 3 cc. concentrated H_2SO_4 refluxed azeotropically and distilled gave 71.9 g. di-Et **ester** (VII) of III, m. 51°. VII (67.7 g.) in 100 cc. dry Et_2O reduced with 14.8 g. $LiAlH_4$ in 750 cc. dry Et_2O yielded 47.5 g. 1,2-bis(hydroxymethyl)-3,4-diphenylcyclobutane (VIII), m. 110-11° (MeOH). VIII (13.4 g.) added in several portions with stirring and cooling to 13.7 g. PBr_3, stirred at room temperature to solution, heated 8 hrs. at 80°, cooled, diluted with 25 cc. H_2O, extracted with C_6H_6, the extract washed, dried, evaporated, and the residue recrystd. from CCl_4-pentane yielded 15.2 g. 1,2-bis(bromomethyl)-3,4-diphenylcyclobutane (IX), 95.5-6.5°. IX (3.94 g.), 4.8 g. Me_3N, and 2 cc. MeOH kept 1 week at room temperature in a sealed tube gave 5 g. 1,2-bis(dimethylaminomethyl)-3,4-diphenylcyclobutane dimethobromide (X), characterized as the dipicrate, m. 255-6° (decomposition) (EtOH). X (2.56 g.) in 10 cc. H_2O treated with Ag_2O from 3.4 g. $AgNO_3$ and 1.4 g. KOH, stirred 2 hrs., filtered, evaporated, the residual glassy solid heated at 120-40°/0.4-0.5 mm., and the sublimate (0.75-0.9 g.) resublimed at 55°/0.4 mm. and recrystd. from MeOH gave I, needles, m. 63-4°. I in EtOAc hydrogenated at 25°/736.5 mm. over prereduced PtO_2 during 1 hr. and the crude product chromatographed on Al_2O_3 gave 2,3-diphenyl-1,4-dimethylcyclobutene, $n^{25}D$ 1.5892. I (114.3 mg.) in 30 cc. CH_2Cl_2 treated with ozonized O at -78° during 0.5 hr., added with stirring to 0.2 g. Zn dust in 10 cc. AcOH, stirred 0.5 hr. at room temperature, distilled into 200 mg. dimedon, a drop piperidine, and 10 cc. 75% EtOH, and the distillate heated until all CH_2Cl_2 was removed and cooled gave 35 mg. dimedon derivative of CH_2O, needles, m. 190-1°. IX (3.94 g.), 1.78 g. N-bromosuccinimide, a few crystals of Bz_2O_2, and 100 cc. CCl_4 refluxed 1 hr. and filtered, the filtrate concentrated to about 10 cc., and diluted with pentane gave 3.4 g. 3-Br derivative (XI) of IX, plates, m. 105-5.5° (decomposition). XI and excess Me_3N heated 2 days at 50° in MeOH in a sealed tube and the mixture evaporated gave 4.5 g. mixture of the 2(or 3)-butene analog (XII) and the 3(or 2)-analog (XIII) of X; the mixture extracted with CH_2Cl_2 left 1.5 g. of one of the isomers, m. 200-4° [picrate m. 228-30° (decomposition) (EtOH)]; the extract evaporated and the residue recrystd. from H_2O yielded the other isomer, m. 185-7°, which did not yield a solid picrate. Mixture (2.04 g.) of XII and XIII converted in the usual manner to the base mixture and the crude product (1.21 g.) pyrolyzed gave 0.28-0.35 g. crude product which resublimed at 40°/0.3 mm. gave II, m. 42-3°; II could be kept several days at 0° under N without visible change but it turned yellow at room temperature within a few hrs.; in all pyrolyses 0.25-0.3 g. dark polymeric residue was formed; it could be repptd. from C_6H_6 with hexane. II hydrogenated over PtO_2 absorbed 90% of 3 equivs. H. The reductive ozonolysis of II yielded 34% CH_2O. II (0.32 g.) in 2 cc. CCl_4 titrated at 0° with 10% Br in CCl_4 and evaporated in vacuo gave 0.75 g. 1,2-dibromo-1,2-bis(bromomethyl)-3,4-diphenyl-3-cyclobutene, m. 118-19° (Et_2O). II did not react at 25° with maleic anhydride, N-phenylmalimide, and (.tplbond.CCO_2Et)2 (XIV), but polymerization occurred in all cases at higher temps.; II and XIV heated at 150° and the crude product chromatographed gave a small amount of amorphous product, decompose 160-70°. II (0.34 g.), in a few cc. C_6H_6 treated under N with 0.35 g. IV in C_6H_6, refluxed 0.5 hr., kept at room temperature overnight, evaporated in vacuo, the dark residue extracted with boiling Et_2O to leave an insol. polymeric residue, and the extract treated with Norite and evaporated gave 0.18 g. 1,1,2,2-tetracyano-5,6-diphenyl-7-methylenespiro[3.3]-5-heptene (XV), needles, m. 175-6° (decomposition). XV (47 mg.) in 0.5 cc. $CHCl_3$ titrated with Br in $CHCl_3$, the solution evaporated,

and the crude residue recrystd. from Et2O gave 1,1,2,2-tetracyano-5-bromo-5-(bromomethyl)-6,7-diphenylspiro[3.3]-6-heptene, m. 162.5-63° (decomposition). I (0.2144 g.) in 5 cc. dry Et2O added to 0.120 g. IV in 10 cc. Et2O, shaken 3 hrs. at room temperature, and evaporated in vacuo gave 1,1,2,2-tetracyano-5,7-diphenyl-5-methylspiro[3.3]-5-heptene, light yellow glass, m. 139.5-40.5° (decomposition) (Et2O-petr. ether). Crude 2-cyclohexenemethanol (XVI) (13 g.) and 17.3 g. phthalic anhydride in 15 cc. PhMe refluxed 3 hrs., kept at room temperature overnight, diluted with Et2O, filtered, the filtrate extracted with aqueous Na2CO3, the alkaline extract acidified and extracted with CH2Cl2, the extract filtered and evaporated, and the residue recrystd. from hexane-Et2O gave acid phthalate (XVII) of XVI, m. 73.5-5.5° (hexane-Et2O). XVII (32 g.) in 180 cc. 25% aqueous NaOH refluxed 2 hrs. gave 12.7 g. pure XVI, b8 95°, n25D 1.4820, which treated with Ac2O and C5H5N at room temperature gave 16.7 g. acetate (XVIII) of XVI, b15 95-6°, n25D 1.4575. XVIII pyrolyzed at 525 ± 15° gave 6.9 g. crude pyrolyzate which fractionated gave V, b. 109-10°, n25D 1.4895. V (1.6 g.) added to 1.6 g. IV in C6H6, refluxed 10 min., kept at room temperature overnight, filtered, the filtrate evaporated, and the residue recrystd. from Et2O yielded 1.4 g. 1,1,2,2-tetracyanospiro[3.5]-5-nonene, m. 121-2° (decomposition) with softening and yellowing at 100-16° depending on the rate of heating. IV in C6H6 treated with the usual fashion with VI and the mixture refluxed 0.5 hr. yielded 100% 8,8,9,9-tetracyanoquadricyclo[2.2.1.02,6.23,5]nonane (XIX), m. 186-8° (decomposition) (C6H6); when the addition was carried out at room temperature during 3-4 days a lower melting form, m. 158-60°, of XIX was obtained in 100% yield; the lower melting form changed after standing at room temperature for more than 1 week to the higher melting modification. XIX (1.3 g.) refluxed 24 hrs. with 10 g. NaOH in 12 cc. H2O and 30 cc. EtOH, acidified, concentrated, diluted with 10 cc. H2O, extracted with Et2O, and the glassy residue (1.6 g.) recrystd. from C6H6-Et2O yielded 1.25 g. 8,9-dicarboxyquadricyclo[2.2.1.02,6.23,5]nonane-8,9-dicarboximide, m. 205-7° (with effervescence). Methylene-1,2-cyclopropanedicarboxylic acid, methylenecyclobutane, methylenecyclononane, and norbornene added to saturated solns. of IV in C6H6, kept at room temperature overnight, and heated several hrs. at 80-90° gave only unchanged starting materials. The infrared absorption spectra of I and II are recorded.

AB Bis-ω-haloalkylesters (I) of aliphatic dicarboxylic acids (II) are treated with gaseous Me3N in an inert solvent (e.g., Et2O, Me2CO, C6H6) to give **quaternary** salts. I and II are prepared from dihalides (preferably dibromides) of the acids with ethylene oxide. The **dicarboxylic acid** dichlorides may be converted into the dibromides by heating with gaseous HBr. E.g., 310 g. succinyl dichloride is brominated with HBr at 45° until the weight is 500-20 g., then fractionated to yield 85-90% succinyl dibromide III, b12 108-14°. III (488 g.) and a few crystals ZnCl2 is treated with 200 g. ethylene oxide and fractionated to give 85-90% succinylbis(bromoethyl) **ester**, b3.5 163-70° (IV). IV (166 g.) is dissolved in 400 cc. dry Me2CO and treated with a minute excess of Me3N gas yielding crystalline succinylbischoline **ester** dibromide, m. 225-7°, yield 80-5% (MeOH).

AB cf. C.A. 51, 4409a. Some N derivs. of lithiobilianic acid (I) and sitosterol are prepared I is treated with Ac2O followed by Me2NH to yield lithiobilianic acid 3-monodimethylamide, m. 251-2°. I with Ac2O followed by PCl5 and then with Me2NH in Et2O gives an Et2O phase containing 60%-70% I 3,4,24-tris(dimethylamide), m. 151-2°, purified by chromatography on Al2O3. The aqueous phase of the reaction yields 15-20% of I 3,24-bis(dimethylamide) (II), m. 232-3°. II is esterified with CH2N2 and reduced with LiAlH4 in tetrahydrofuran to 3,4-secocholan-4-ol-3,24-bis(dimethylamine hydrochloride), m. 292-5° (decomposition). II is similarly reduced to 90% 3,4-secocholane-3,4,24-tris(dimethylamine hydrochloride), decompose 275°, which forms 3,4-secocholane-3,24-tris(trimethylammonium iodide), m. 290° (decomposition). The **dicarboxylic acid** of sitosterol (III), heated 2 hrs. with Ac2O gives 76% 2,3-secositostanol-2,3-**dicarboxylic acid** anhydride, m. 176°. III di-Me **ester** is reduced by LiAlH4 to 88% 2,3-secositostane-2,3-diol, m. 182-3° (MeOH). III with PCl5 and Me2NH yields by chromatography on Al2O3 48% 2,3-secositostane-2,3-**dicarboxylic acid** dimethylamide, m. 106-7°, reduced by LiAlH4 to 68% 2,3-secositostane-2,3-bis(dimethylamine hydrochloride), m. 326° (decomposition). This compound with MeI gives 2,3-secositostane-2,3-bis(trimethylammonium iodide), m. 323°.

AB cf. C.A. 45, 6017e. The conds. in MeOH at 25° of the following salts were measured: N,N'-bis(2-dimethylaminoethyl)oxalamide-di-MeI, N,N'-bis(2-dimethylaminoethyl)succinamide-di-MeI, N,N'-bis(2-dimethylaminoethyl)adipamide-di-MeI, and N,N'-bis(2-dimethylaminoethyl)suberamide-di-MeI. These salts are bolaform electrolytes with, resp., 8, 10, 12, and 14 atoms joining their 2 **quaternary** nitrogens. The constant k2, which describes the interaction of a bolaform cation and an anion, is practically the same for the oxalic and the suberic derivs., and is somewhat larger for these compds. than for the succinic and adipic derivs. This observation suggests that an intramol. ring structure, stabilized by H bonds between the **amide** groups is formed, which shortens the effective charge-charge distance.

AB The neuromuscular blocking action in nonanesthetized dogs and chloralosed cats and the spastic paralysis in pigeons decrease with increasing C-chain length of the following: bischoline esters of succinic, adipic, and sebacic acids and their ethyl derivs. The contracture response of the isolated rectus abdominis of the frog increased with chain length and was antagonized by d-tubocurarine. The hypertensive effect also increased in this manner. However, the adipic acid diester of triethyl(2-hydroxyethyl)ammonium iodide caused flaccid paralysis in pigeons and reduced the sensitivity of the frog rectus abdominis to acetylcholine.

AB Shamrock surfactants are surfactants containing two ionic or polar nonionic head groups, each connected to a central ionic head group by a hydrocarbon linking moiety, wherein the central head group is a dithiophosphate, dithiocarbamate, or quaternary ammonium group. These surfactants have potential applications in chemical decontamination of mustard (simulants), storage and release devices/chemical switches and the remediation of heavy-metal ion-contaminated water. Such a surfactant compound is of the formula [X-L-Z-L'-X'](A)p, wherein X and X' represent outer head groups, which may be the same or different and comprise charged moieties selected from the group of -N+R1R2R3, R1, R2 and R3 being the same or different, representing hydrocarbyl groups, -CO2- or -O(CH2)mSO3-, m being an integer from 2 to 30, or polar moieties of the formula, -O-(CH2CH2O)nR4, R4 being hydrogen or a C1-C6 hydrocarbyl group and n is an integer from 1 to 1000; L and L' are the same or different and represent a hydrocarbon linking moiety which may optionally be interrupted with oxygen; Z represents a central head group selected from a dithiophosphate moiety, dithiocarbamate or a quaternary ammonium moiety, wherein R5 and R6 are the same or different and represent C1-C6 hydrocarbyl groups, with the proviso that when Z represents said dithiocarbamate moiety or said quaternary ammonium moiety, X and X' do not represent N+R1R2R3, and with the further proviso that X and X' do not represent -O(CH2)mSO3- unless Z represents said quaternary ammonium moiety; and A represents a counter ion, which may be either pos. or neg. depending on the net charge of [X-L-Z-L'-X'] and p is an integer which, when multiplied by the valency of said counter ion yields the absolute value of the net charge of [X-L- Z-L'-X'].

AB New cationic Gemini surfactants with a rigid spacer group of xylene were synthesized, their compns. and structures were characterized. The cmc and the solubilizations of 1-dodecene in micellar solution were determined by surface tension method and UV-Vis spectrometry resp. The cmc of new Gemini surfactants are lower than CTAB by about an order, but the solubilizations of 1-dodecene in Gemini surfactants solution are higher than that in CTAB solution The promotion effect of cationic Gemini surfactants on 1-dodecene hydroformylation in biphasic catalytic system was studied. The results indicated that in the biphasic system containing the catalysts RhCl(CO)(TPPTS)2 and TPPTS, [TPPTS = tris (sodium-m-sulfonatophenyl) phosphine], the reaction rate of 1-dodecene hydroformylation in the presence of Gemini surfactants was faster than that in the presence of conventional surfactant CATB, e.g., the conversion of 1-dodecene is 90% when G (o-xyl)c22 concentration in aqueous solution was 2 + 10-3 mol/L, however, the conversion was only 20.4% when the concentration of CTAB was 3 + 10-3 mol/L. The greater acceleration of Gemini surfactants in 1-dodecene hydroformylation could be attributed to that cationic Gemini surfactants had lower cmc and better solubilization for the substrate. The lower cmc arid surface tension are favorable for increasing the interfacial area of two phases, breaking phase barrier and promoting the substrate transfer to interface where the substrates coordinate with the active rhodium complex anion species. The regioselectivity for olefin hydroformylation in Gemini surfactants.

AB Two types of a new class of surfactants with 3 headgroups were prepared A central headgroup is connected to 2 flanking headgroups by hydrocarbon chains. The term "shamrock" is used to describe these surfactants, denoting their triple-headed character and reflecting the fact that shamrocks have leaflets in groups of 3. The major lipophilic character of shamrock surfactants is provided by the 2 hydrocarbon chains linking the 3 headgroups and not by long-chain alkyl groups appended to the linking hydrocarbon chains or the headgroups. The new surfactants are (2,2,15,15,28,28-hexamethyl-2,15,28-triazonianonacosane triiodide), (2,2,15,15,28,28-hexamethyl-2,15,28-triazonianonacosane trichloride) (I), (O,O'-di-[10-(N,N,N-tripropylammonio)decyl]phosphorodithioate bromide), and (O,O'-di-[10-(N,N,N-tributylammonio)decyl]phosphorodithioate bromide). (2,2,9,9,16,16-Hexamethyl-2,9,16-triazoniaheptadecane triiodide) was prepared for comparison. The surfactants were characterized in water by measurement of their Krafft temps. and critical aggregation concns., and their aggregates were studied by 1H NMR spectroscopy, dynamic laser light scattering, and phase-contrast optical microscopy. Aqueous I was also studied by cryo-etch high-resolution SEM, which revealed irregularly shaped cells containing a complex matrix of surfactant. Coacervates were observed by optical microscopy upon the hydration of the shamrock surfactants.

AB   cf. C.A. 51, 4409a.  Some N derivs. of lithiobilianic acid (I) and
     sitosterol are prepared  I is treated with Ac2O followed by Me2NH to yield
     lithiobilianic acid 3-monodimethylamide, m. 251-2°.  I with Ac2O
     followed by PCl5 and then with Me2NH in Et2O gives an Et2O phase containing
     60%-70% I 3,4,24-tris(dimethylamide), m. 151-2°, purified by
     chromatography on Al2O3.  The aqueous phase of the reaction yields 15-20% of I
     3,24-bis(dimethylamide) (II), m. 232-3°.  II is esterified with
     CH2N2 and reduced with LiAlH4 in tetrahydrofuran to 3,4-secocholan-4-ol-
     3,24-bis(dimethylamine hydrochloride), m. 292-5° (decomposition).  II is
     similarly reduced to 90% 3,4-secocholane-3,4,24-tris(dimethylamine
     hydrochloride), decompose 275°, which forms 3,4-secocholane-3,24-
```

tris(trimethylammonium iodide), m. 290° (decomposition). The **dicarboxylic acid** of sitosterol (III), heated 2 hrs. with Ac2O gives 76% 2,3-secositostanol-2,3-**dicarboxylic acid** anhydride, m. 176°. III di-Me **ester** is reduced by LiAlH4 to 88% 2,3-secositostane-2,3-diol, m. 182-3° (MeOH). III with PCl5 and Me2NH yields by chromatography on Al2O3 48% 2,3-secositostane-2,3-**dicarboxylic acid** dimethylamide, m. 106-7°, reduced by LiAlH4 to 68% 2,3-secositostane-2,3-bis(dimethylamine hydrochloride), m. 326° (decomposition). This compound with MeI gives 2,3-secositostane-2,3-bis(trimethylammonium iodide), m. 323°.

AB A series of organo-montmorillonites and organo-hectorites were prepared by complete ion-exchange from the pure sodium form of the parent smectites. The organic cations were tetramethylammonium, tri-Me **quaternary** ammonium derivs. of lysine Me **ester** and ornithine Me **ester, quaternized** polyammonium cations, or tetraphenylphosphonium (TPP). These organo-smectites were used as packing material for gas chromatog. columns. Mixts. of light (C1-4) hydrocarbons could be separated The degree of separation depends on the presence of micropores or of organophilic mesopores. The BET surface area, the micropore and mesopore vols., as well as the size distribution of micropores and mesopores, were measured for several systems. As a general trend, the retention times of the light hydrocarbons decreased with increasing micropore volume In the case of TPP-montmorillonite, characterized by a large mesopore volume but for which no microporosity could be detected, separation of longer (C5-8) alkanes could also be achieved.

IT **108189-65-7D,** reaction products with hectorite and montmorillonite

AB The present invention relates to methods of delivering pharmaceutical agents across membranes, including the skin layer or mucosal membranes of a patient. A pharmaceutical agent is covalently bonded to a chemical modifier, via a physiol. cleavable bond, such that the membrane transport and delivery of the agent is enhanced. Progesterone 3-{2-O-[10-O-(O-acetylcarnitinyl)decanoyl]glycolic acid} enol **ester** was prepared from progesterone by preparation of the enol acetate, reaction with 10-hydroxydecanoic acid, and reaction of the hydroxyl diester with 3-O-acetyl-L-carnitine acid chloride (preparation given). In vitro serum half-lives of some pharmaceutical agent-chemical modifier complexes are given.

AB Fourteen cationic multipolar amphiphiles were synthesized with pyridinium or trimethylammonium head groups. The hydrophobic cores are planar ring systems (benzene or triphenylene) to which 2, 3, 4, or 6 decylene or undecylene alkyl chains are attached by **ester** linkages. The hydrophilic head groups are bound to the outer ends of the alkyl chains. The aggregation of the mols. in water into micelles and lyotropic liquid crystals was studied. Hexagonal phases are preferred to lamellar phases by these amphiphiles and in more dilute solns. some of these multipolar amphiphiles form cylindrical micelles.

AB An oil-containing foaming cleanser for skin and hair contains an oil liquid at ambient temperature 5-85, a surfactant soluble in the oil 15-95, a cationic compound 0.5-10, and H2O 0.1-5%. The oil may be plant, animal, or mineral, or synthetic glyceride or fatty acid **ester**, or fatty alc. The oil-soluble surfactant is anionic, with the acid group neutralized with an amine, or nonionic, and (or) alkanolamide. The cationic compound is a polymer containing polyamino, polyaminoamide, or **quaternary** ammonium groups as part of the polymer chain. Thus, a shampoo contained: Texapon

WW 99 [83045-95-8] 15, paraffin oil 25, Polymer P1 [68393-49-7] (60% aqueous solution) 3, perfume, antioxidants, and olive oil to 100 g. In use, 20 mL was applied to wet hair, worked in, allowed to stand 10 min, and rinsed to give soft hair that is easily detangled.

AB Methacrylic acid-N-methacryloylhistamine copolymer (I) [64541-47-5], methacrylamide-N-methacryloylhistamine copolymer [64541-48-6] and methacrylic acid-methacrylohydroxamic acid copolymer (II) [64541-49-7] were prepared and their hydrolytic reactivities toward p-nitrophenyl acetate (III) [830-03-5] and p-nitrophenyl hexanoate (IV) [956-75-2] were studied in the absence and in the presence of hydrophobic ammonium salts. The nucleophilic reactivity of I toward III was hardly affected by the addition of hydrophobic ammonium ions, while a marked increase of rates was found in the reaction with IV. Addition of these ammonium ions to the II system enhanced the rate of reaction with IV by lowering the pKa (0.3-0.4 pK unit) and by increasing the second-order rate constant (.apprx.3-fold), as inferred from the pH-rate profile. The rate-enhancing effect of the hydrophobic ammonium salts was analyzed by using the Hill equation which has been employed for analyzing allosteric behavior in enzyme systems; the observed coefficient (n = 3-4) suggested that polymer-bound ammonium ions facilitated the subsequent binding.

AB Acetylcholinesterase (EC 3.1.1.7) was readily inhibited by 10-5M diphenylphosphorochloridate even though the inhibitor hydrolyzes in a few seconds. The fluoridate was a much weaker inhibitor. The inhibited enzyme, diphenylphosphoryl enzyme spontaneously recovered only .apprx.50% of its activity with a half time of .apprx.17 min at pH 7.0 and 6 min at pH 8.0. The fact that only 50% of the original activity returns was due to aging. The rates of reactivation and aging were very greatly increased by a few percent of an organic solvent. Depending on the solvent, even 1% may increase the rates by a factor of 5-6. The highest increase in rate was 70-fold. **Quaternary** NH4+ also increased the rates. Organic solvents and NH4+ also accelerated the reactivation of the much more stable diethylphosphoryl enzyme derivative

AB Carbamoylcholine was the most active excitant tested on cat neurons. Synaptic excitation by the optic nerve, but not by acetylcholine, was suppressed by 5-hydroxytryptamine; dihydro-β-erythroidine had the inverse effect.

AB cf. CA 58, 2326b, 3714f. The relation between the structure and paper chromatographic behavior of 30 basic drugs was studied, using the reverse phase system petroleum (b.p. 195-220°)-EtOH-H2ONH3, in which the proportions of EtOH and H2O were varied 7 times. In all cases except 3, Rf increased with increasing EtOH content for 20 tertiary bases and decreased for 10 **quaternary** bases. For most compds., the Rf was lower at 12-13° than at 17°. Rf values in the 7 solvent systems are tabulated for all compds.

AB In a study of the effect of limiting the flexibility of the chains of methonium compds. on the pharmacol. actions of certain stereoisomers, analogs of hexamethonium and succinylcholine carrying a cis or trans oriented cyclopropane ring in the center of the chain were synthesized. The geometric isomers of bis(trimethylammoniumethyl) cyclopropane-1,2-dicarboxylate and of the homologous cyclopropane-1,2-diacetate **ester** diiodides caused predominantly neuromuscular block and resembled succinylcholine. The geometric isomers of 1,2-bis(β-trimethylammoniumethyl)cyclopropane diiodide exerted primarily ganglionic blockade of the hexamethonium type. The trans isomer was the more potent in each case.

AB cf. CA 54, 11981c; 56, 7932c. The short series of linear trisonium esters are synthesized and are compared with tubocurarine, and suxamethonium for neuromuscular-blocking properties, potency, and toxicity. All compds. synthesized are tubocurarine-like except the methonium derivative (I), which is a depolarizing agent. I (3.0 mg./kg.) causes an inhibition of

contractions and the development of contracture in the gastrocnemins musclesciatic nerve preparation of the pentobarbitone-anesthetized hen. Similar effects are obtained with 0.05 mg./kg. suxamethonium chloride.

AB cf. CA 53, 6088e. A series of hydroxyalkyliminobisacetamides, HOXN(CH2CONRR1)CH2CONR2R3 (where X is alkylene, cycloalkylene, or aralkylene, R, R1, R2, R3 represent lower alkyl or aralkyl, and where RR1 may or may not equal R2R3), were prepared, examined for local anesthetic action, and studied for structure-activity relationships. The preparation of

all chloroacetamides, hydroxyalkylaminoacetamides, hydroxyalkyliminoacetamides and their esters were carried out essentially in the same manner. PhCH2CMe2NHMe (0.86 mole) in 500 ml. PhMe stirred 1 hr. at -15° with addition of 0.40 mole ClCH2COCl, the mixture filtered at 20°, the amine HCl salt washed with PhMe, the combined filtrate and washings dried, and the residue on evaporation distilled yielded 70.5% PhCH2CMe2NMeCOCH2Cl (I), b0.5 140-1°. HOCH2CH2 NH2 (0.1 mole) and 30 g. anhydrous powdered Na2CO3 in 300 ml. well-stirred boiling BuOH slowly treated with 0.1 mole I in 50 ml. BuOH, the mixture refluxed 12 hrs., cooled, and filtered, and the residue on evaporation crystallized from C6H14 yielded 63% HOCH2CH2NHCH2CONMeCMe2CH2Ph, m. 74.5-6.5°; HCl salt, m. 163-4°. Similarly were prepared and tabulated hydroxyalkylaminoacetamides, RNHCH2CONR1Me (R, R1, and m.p. HCl salt given): PhCHOHCH2, PhCH2CMe2, 201-2°; PhCHOHCMe2, PhCH2CMe2, 189-90°; HOCH2CMe2, PhCH2CMe2, 169-70°; (HOCH2)3C, PhCH2CMe2, 175-6°; HOCHMeCH2, PhCH2, 134-5°. I (0.1 mole) and 20 g. K2CO3 in 250 ml. boiling BuOH stirred with addition of 0.05 mole freshly distilled HOCH2CH2NH2, the mixture refluxed 20 hrs. and the cooled mixture filtered, the filtrate washed (aqueous 5% Na2CO3, H2O) and the dried (MgSO4) solution evaporated in vacuo yielded 71% hydroxyalkyliminobisacetamide, RN(CH2CONR1R2)2 (II) (R = HOCH2CH2, R1 = Me, R2 = PhCH2CMe2) (III), m. 104-5°; HCl salt m. 146-7° (MeOH-Me2CO); nicotinic acid **ester** m. 158-9°. III (20 g.) in 100 ml. dry CHCl3 treated with 5 g. SOCl2 in 25 ml. CHCl3, the mixture stirred 3 hrs., and the residue on evaporation crystallized from alc.-Et2O yielded 79 g. II (R = ClCH2CH2, R1 = Me, R2 = PhCH2CMe2) HCl salt (IV), m. 155-6° (alc.-Et2O). IV (3 g.) in 20 ml. MeOH containing 3 g. anhydrous NH3 heated 18 hrs. at 90° in a pressure tube, the cooled mixture and MeOH rinsings filtered from NH4Cl, freed from MeOH and excess NH3, and taken up in 50 ml. Me2CHOH, and the filtered solution treated with dry HCl and diluted with 150 ml. dry Et2O yielded 40.5% II (R = H2NCH2CH2, R1 = Me, R2 = PhCH2CMe2), m. 231-2°. III (0.02 mole) in 150 ml. dry Et2O added slowly with stirring to 1.8 g. LiAlH4 in 300 ml. dry Et2O, the mixture refluxed 25 hrs. before cautious decomposition with 8 ml. H2O, the dried Et2O layer treated with HCl, the oily product triturated with Me2CO, and the product (29.3%) recrystd. from MeOHMe2CO yielded HOCH2CH2N(CH2CH2NMeCMe2CH2Ph)2, m. 229-30° (decomposition); tri-HCl salt m. 239-40°; MeI salt, m. 122-3°; tri-MeI salt, m. 154-5°. To obtain the bis compds. with sterically hindered amino alcs., the use of a higher boiling solvent (such as PhOMe) was necessary. Phys. and pharmacol. data are tabulated for the various series of compds., RN(CH2CONR1R2)2 (R, R1, R2, b.p./mm., duration of activity on rabbit cornea and % solution given): HOCH2CH2, (R1R2=)CH2CH2, 203-5°/1.0, neg., 0.1; HOCH2CH2, Me(CH2)3, Me(CH2)3, 208-10°/0.5, 25 min., 0.01; MeCHOHCH2, Me(CH2)3, Me(CH2)3, 200-5°/0.1, neg., 0.1; HOCH2CH2, Me2CHCH2, Me2CHCH2, 170-1°/0.5, neg., 0.1; HO(CH2)3, Me2CHCH2, Me2CHCH2, 190-2°/0.5, neg., 0.1; HOCH2CMe2, Me(CH2)3, Me(CH2)3, 155-60°/0.5, neg., 0.1; HOCH2CMe2, MeCH2, Me(CH2)3, 170-5°/0.5, neg., 0.1; HO(CH2)22, Me(CH2)4, Me(CH2)4, 230-5°/1.0, neg., 0.1; HO(CH2)2, C6H11, C6H11, - (HCl salt m. 215-16°), neg., 0.1; HO(CH2)2, Me(CH2)5, Me(CH2)5, 194-6°/0.5, 48 min., 0.1. Me, PhCH2CMe2, 203-4° (HCl salt), neg., 0.1; HO(CH2)2, Me, C6H11, 190-5°/1.0, neg., 0.1; HO(CH2)2, H, PhCH2CH2, 72-3° (HCl salt), neg., 0.1; HO(CH2)2, Me(CH2)3, PhCH2, 118° (HCl salt), 29, 0.001; HOCHMeCH2, Me(CH2)5, PhCH2, 195-200°/0.05, 44, 0.1; HOCHMeCH2, H, 2,6-Me2C6H3, 193-4° (HCl salt), neg. 0.1. For RN(CH2CONR1R2)CH2CONR3R4 (R, R1, R2, R3, R4, b.p./mm, or m.p. of base or HCl salt, duration, and % solution given): HO(CH2)2, MeCH2, MeCH2, Me(CH2)3, Me(CH2)3, 203-5°/1.0, 29. 0.1; HO(CH2)2, Me(CH2)2, Me(CH2)2, Me(CH2))3, Me2CHCH2, 198-200°/0.5, 21, 0.1; HO(CH2)2, MeCH2, MeCH2, Me, PhCH2CMe2, 121-2°, neg., 0.1; HO(CH2)2, Me(CH2)4, Me(CH2)4, Me, PhCH2CMe2, 92-3°, 63, 0.1; HO(CH2)3, Me2CHCH2, Me2CHCH2, Me, C6H11, 205-80/1.0, neg., 0.1; HO(CH2)2, Me, PhCH2CHMe, Me, PhCH2CMe2, hygroscopic, 55, 0.001; HO(CH2)2, H, PhCH2CH2, Me, PhCH2CMe2, 158° (HCl salt), neg., 0.1; HO(CH2)2, H, HOCH2CH2, Me, PhCH2CMe2, 42° (HCl salt), neg., 0.1; HO(CH2)2, H, Me(CH2)5, Me, PhCH2CMe2, 260°/1.0, 9, 0.05. For XCH2CH2N(CH2CONR1R2)2 (X, R1, R2, m.p. HCl salt, duration, and % solution): MeCO2, Me, PhCH2CMe2, 169-70°, 32, 0.001; Me(CH2)10CO2, Me, PhCH2CMe2, 143-5°, 38, 0.01; p-MeC6H4CO2, Me, PhCH2CMe2, 168-9°, 42, 0.001; p-O2NC6H4CO2, Me, PhCH2CMe2, 168-9°, 27, 0.0005; MeCO2, Me(CH2)3, Me(CH2)3, 212-14°/0.05(base), 32, 0.01; m-ClC6H4CO2, Me, PhCH2CMe2, 87-8° (base, from Me2CHOH-petr. ether), active, 0.1; (3-C5H4N)CO2, Me, PhCH2CMe2, 158-9°, 35, 0.0005; p-MeOC6H4CO2, Me, PhCH2CMe2, 126-7°, active, 0.1; p-H2NC6H4CO2, Me, PhCH2CMe2, 199-200°, active, 0.1. Iminoacetamides in which the amido N was derived from aliphatic amines had relatively little local anesthetic action and were more toxic than those derived from aralkyl amines. The use of PhCH2CMe2NHMe produced the highest degree of local anesthetic activity in II. Substitution of PhCH2CHMeNHMe in 1 **amide** group halved the activity. In the alkanolamine moiety, use of a sterically hindered base (H2NCMe2CH2OH) markedly reduced activity. Separation of HO from the tertiary amino group by interposition of CH2 groups reduced activity. The activity of HOCH2CH2CH2N(CH2CONMeCMe2CH2Ph)2 was 1/500 of that of the homologous HOCH2CH2N(CH2CONMeCMe2CH2Ph)2. Replacement of HO by NH2 or Cl, and **quaternization** of the tertiary amine or reduction of the **amide** groups to tertiary amines all resulted in nearly complete loss of activity. The activity was not increased by **ester** formation.

AB The following compds. with curare-like activity were investigated: d-tubocurarine, decamethonium, succinylcholine, flaxedil, and C100 (derivative of belladonna). The concentration of the curare-like compds. was kept at 10-5-10-4M while the concentration of cystine was maintained at 10-5M at pH 9.4.
The polarogram curves were traced at 3.8 v. and temperature 22°. Flaxedil was the most active. These **quaternary** compds. showed a pos. increase in the polarographic wave of cystine. The expts. indicated a close relation between the SH groups and the curare-like activities of compds. 13 references

AB cf. C.A. 52, 8036f. 6-Hydroxyhexyldiethylamine (35.2 g.) in 95 ml. 48% HBr and 33 ml. H2SO4 was refluxed 4 hrs., cooled, poured into 1 l. H2O, Na2CO3 added and the mixture extracted with CHCl3, and the dried extract (Na2SO4) evaporated in vacuo to obtain crude 6-bromohexyldiethylamine (I) as a reddish brown oil containing crystalline material. The I obtained and 40 ml. ethylamine refluxed 2 hrs. and EtNH2 and CHCl3 evaporated yielded a damp crystalline mass;

this basified, extracted with, Et2O, and the extract evaporated yielded 24.8 g. oil,
distilled to yield 53% 6-ethylaminohexyldiethylamine (II), b0.55 86-9°, n17D 1.4493; di-HCl salt m. 172-3° (EtOH-Et2O). Crystalline material separated from crude II was 1,1-diethyl-1-azacycloheptylinium bromide, m. 250° (decomposition) (EtOH-Et2O). II and 6-chlorohexyldiethylamine refluxed in xylene 5 hrs. formed 19% bis(6-diethylaminohexyl)ethylamine, pale yellow oil, b0.7 165-8°, n18D 1.4610; this was refluxed 10 min. with EtI to form 7,7-diethyl-7-azoniatridecylenebis(triethylammonium) triiodide, m. 261-2°, needles (EtOH). Bis(10-diethylaminodecyl) sulfide was refluxed with EtI to form 27% 11-ethyl-11-thioniaheneicosylenebis(triethyl ammonium) triiodide, m. 123.5-24°, needles (Me2CO-Et2O). 10-Bromodecyldiethylamine (84%), b0.5 130°, n14D 1.4717, was obtained as an oil by the method for I. 10-Ethylaminodecyldiethylamine (76%), an oil, b0.8 133-5°, n18D 1.4535; di-HCl salt m. 147-8° (EtOH-Et2O). Bis(10-diethylaminodecyl)ethylamine (26.5%), pale yellow oil, b0.25 212-16°, n14D 1.4660; tri-HCl salt, m. 118° (Me2CO-Et2O). 11,11-Diethyl-11-azoniaheneicosylenebis(triethy lammonium) triiodide (90%) m. 202.5-3.5° (Me2CO-Et2O). 1,1-Bis(ethoxycarbonyl)-7-diethylaminoheptane (47.65%), pale yellow oil, b0.8 147-55°, n15.5D 1.4472, was used to prepare 62% Et 8-diethylaminocaprylate (III), an oil, b0.65 111-14°, n18D 1.4428; this reacted with EtI to form 7-ethoxycarbonylheptyltriethylammonium iodide, m. 64.5-5.5° (Me2CO-Et2O). III was reduced with LiAlH4 to obtain 90% 8-hydroxyoctyldiethylamine, an oil, b0.7 114-17°, n16.5D 1.4590; HCl salt m. 90-1° (EtOH-Et2O). 8-Chlorooctyldiethylamine (96%), an oil, b0.55 94-6°, n17D 1.4550 (literature, b11 130.5°, n18D 1.4535). Bis(8-diethylaminooctyl) sulfide (72%), straw-colored liquid, b0.65 210-12°, n18.5D 1.4768; di-HCl salt m. 145° (EtOH). 9-Ethyl-9-thioniaheptadecylenebis(triethylammonium) triiodide (47%) m. 159-60° (decomposition) (EtOH-Et2O). 8-Ethylaminooctyldiethylamine (76%), an oil, b0.7 104-6°, n17.5D 1.4530; di-HCl salt, hygroscopic, m. 159.5-60.5° (EtOH-Et2O). Bis(8-diethylaminooctyl)ethylamine (18%), yellow oil, b0.8 230-50°, n17D 1.4642; tri-HCl salt m. 165-6° (decomposition) (Me2CO-Et2O). 9,9-Diethyl-9-azoniaheptadecylenebis(triethylammonium) triiodide m. 251-2° (decomposition) (EtOH). 7-Dioxothiatridecylenebis(triethylammoni um iodide) (47%), pale buff solid, m. 144-5° (Me2CO-Et2O). All the compds. tested showed neuromuscular blocking activity. Dihexazonium triethiodide and the sulfone 7-dioxathiatridecylenebis(triethylammonium iodide) (dihexone) showed tubocurarinelike activity; dioctasulfonium and dioctazonium triethiodides were predominantly tubocurarinelike but had some transitional properties. Didecasulfonium and didecazonium triethiodides resembled decamethonium. Dihexazonium triethiodide was equipotent with tubocurarine on the cat. Marked species variations in potency were noted.

AB cf. C.A. 50, 7803h. The disulfimides (I) as strong acids form with organic bases crystalline salts poorly soluble in water. The most useful I is (4-ClC6H4SO2)2NNa (II), prepared by mixing NH4Cl and p-ClC6H4SO2Cl in Me2CO, adding 30% NaOH solution, and heating gently to distil off the Me2CO. The base (IIA) is prepared by dissolving II in hot water and precipitating with HCl, dissolving in anhydrous Et2O, evaporating, and crystallizing from C6H6. IIA, m. 205-6°, is well suited for the isolation, characterization, and determination of primary, secondary, tertiary, and **quaternary** amines, preferable often to picric acid or perchlorates, and especially for the **quaternary** compds., with which they form stable crystalline compds. with sharp m.ps. The amine or its salt combines with I or their alkaline salts in an ionic reaction. The free base in Et2O solution may be left to react with I directly, or I Na is mixed in aqueous, alc., or Me2CO solution with the **quaternary** base or its salts, advantageously with heat. An excess of either component retards crystallization, hence molar proportions must be used as closely as possible. The following medicinals were crystallized (compound and m.p. of product with IIA (uncorrected) given): anesthesine 150-1°; procaine 141-2°; 2-diethylaminoethanol 76-7°; coramine 153-4°; dilatol [1-(p-hydroxyphenyl)-2-(1-methyl-3-phenylpropylamino)propanol-HCl] 175-6°; sympathol 168-9°; dispasmol (N-benzyl-N',N'-dimethyl-N-phenylethylenediamine) 141-2°; rodismin (N-benzyl-N',N'-diethyl-N-phenylethylenediamine) 94-5°, 2-(α-phenyl-o-tolyloxy)triethylamine-HCl 128-9°; aminopyrine 167-8°; megaphen from 50° (unsharp); sulfanilamide 197-8°; sulfapyridine 165-6°; sulfacetamide Na, yellow crystals 167-8°; sulfaguanidine 108-9°; elkosin 179-80°; nicotinic acid hydrazide from 206° (decompose); tetramethyldecamethylenediamine-di-MeBr 150-1°; flaxedil 62-4°; choline chloride succinate 78-80°; hexamethonium bromide 214-15°; benzedrine 182-3°; thiamine-HCl 206-7°; niacinamide 212-14°; 3-pyridyl benzyl carbonate,

weak rose-colored needles, 167-8°; atrophan, yellowish needles, 171-2°; urotropine 162-3°; ephedrine 184-5°; atropine 145-6°; hyoscyamine 123-5°; papaverine 118-19° (unsharp); hydrastinine 139-40°; and yohimbine 196-7°. To determine satisfactory methods for gravimetric analysis, various I salts of 2 medicinals were prepared Thus, for casantin, were prepared compds. with (4-H2NC6H4SO2)2NH (m. 202-3°), II (m. 111-12°), and (3,4-Cl2C6H3SO2)2NH (III) (m. 146-7°). The last compound was found best because it had the lowest solubility, was well crystallized, and had a high mol. weight For hexamethonium bromide, salts were prepared with II (m. 214-15°) and with III (m. 207-8°). Gravimetric detns. for both compds. were more accurate than volumetric (argentimetric) detns. 11 references.

AB **Quaternary** ammonium compds. (d-tubocurarine chloride, Flaxedil, hexamethonium, decamethonium, and pendiomid) decreased the O consumption of fertilized and unfertilized eggs of R. microtuberculatus. The decrease in metabolism was inversely proportional to drug concentration Phenothiazine derivs. of the chlorpromazine type decreased the O consumption of sea-urchin eggs; above a certain limiting concentration the decrease in metabolism rose sharply and led to complete inhibition of oxidation. When combined with ethylurethan (I) the **quaternary** ammonium compds. showed an additive effect. The combination of phenothiazine derivs. and I gave a potentiating action. By this means, a further difference of the ganglioplegic drugs from the phenothiazine derivs. has been found.

AB cf. C.A. 44, 1603c. Succinylcholine diiodide produces typical curarization in frogs and mammals. Birds, and the isolated frog rectus abdominis, show a nicotine-like contracture. In the dog, there is no effect on the blood pressure or cardiac rhythm except in large doses when the drug causes hypertension and tachycardia. Excess salivation and bronchial secretion occur. The direct excitability of the gastrocnemius muscle is not affected. In the series X(R)3N(CH2)nOOC(CH2)mCOO(CH2)nN(R)3 X the curarizing action is most marked if a chain of about 10 C and O atoms separate the **quaternary** nitrogens, and the substituent groups on the N are Me. Some of the series I(CH3)3N(CH2)5COOCH2CH2N(CH3)3 I, and the series I(CH3)3NCH2CH2OOC(CH2)2COOCH2CH2N(CH3)3 I are also active, but branching of the chain or the introduction of a third or fourth **quaternary** N destroys the activity.

TITLE: Curarizing properties of phenolic ethers with **quaternary** ammonium groups
AUTHOR(S): Bovet, Daniel; Depierre, France; de Lestrange, Yvonne
SOURCE: Compt. rend. (**1947**), 225, 74-6
DOCUMENT TYPE: Journal
LANGUAGE: Unavailable

AB A study was made of the action on striated muscle of synthetic curarizing agents consisting of ethers formed from choline and homologous amino alcs. with phenols and polyphenols. The following compds. were used: C6H5OCH2CH2N(CH3)3I (I), 1,3-C6H4[OCH2CH2N(CH3)3I]2 (II), C6H5OCH2N(C2H5)3I (III), 1,2-C6H4[OCH2CH2N(C2H5)3I]2 (IV), 1,3-C6H4[OCH2CH2N(C2H5)3I]2 (V), 1,4-C6H4[OCH2CH2N(C2H5)I3I]2 (VI),

1,2,3-C6H3[OCH2CH2N(C2H5)3I]3 (VII). In the choline series, I and II were effective in the rabbit in doses of 4 mg. per kg. given intravenously. In the triethylcholine series, III has very slight activity, but IV, V, VI, and especially VII, are very active, the last causing curarization of 3 hrs. duration in the rabbit, in a dose of 0.7 mg. per kg. In the **quaternary** amines, choline and the **ester** salts of choline, particularly acetylcholine and butyl-β-ethylcholine (Dale, C.A. 9, 104) the curarizing effects seem to be closely connected with other cholinergic, muscarinic, and nicotinic manifestations of the mol. It was observed that in the ethers of the polyphenols studied, the cardiovascular effects are considerably attenuated. While I causes hypertension comparable to that produced by nicotine, II exerts only a weak nicotinic action. Likewise, the hypotensive and cardiomoderating effect of III is considerably weakened by the introduction of 1 or 2 more **quaternary** ammonium groups. The effects of VII are particularly striking. This compound is very active in the frog, which is immobilized by it in doses of 10 mg. per kg. In the mouse, the toxic doses are 5.5, 15, and 425 mg., given intravenously, subcutaneously, and per os. In the rabbit, the toxic dose is 0.7 mg. given intravenously, and 2-3.5 mg. per kg. subcutaneously. This represents about 5 times the activity of tubocurarine. In a rabbit given artificial respiration, total paralysis lasts 2.5 hrs. with a dose of 7 mg. and 6 hrs. after 35 mg. To kill a rabbit under these conditions, 350 mg., or about 500 times the toxic dose is necessary. In the chloralosed dog given O by tracheal catheter, the response of the gastrocnemius muscle to elec. excitation at the peripheral end of the sciatic nerve decreases in amplitude, then disappears at the same time as paralysis of the respiratory muscles occurs. The vagus is paralyzed, presumably at the synapses of its cardiac ganglia, but acetylcholine still exerts a large part of its normal effect. The injection of eserine (1-2 mg. per kg. in the atropinized dog) or of prostigmine, results in rapid recovery of muscular excitability. Injection of a dose of VII sufficient to cause curarization for several hrs. has no effect on blood pressure. In this respect the compound is superior to natural curare.
